

* The Tower of Hanoi is a famous mathematical puzzle invented by the French mathematician Edouard Lucas in 1883.

The puzzle consists of three rods and a number of disks of different sizes stacked on one rod. The objective is to move all the disks to another rod while following specific rules.

Lucas also shared a legend about a temple where monks were moving 64 golden disks according to the Tower of Hanoi rules.

The legend says that when the monks finish moving all 64 disks, the world will end.

It is used to teach Recursion / Problem Solving techniques / Algorithm.

UNIT-1

* What is Data Structure?
Data Structure is a method of organizing a large amount of data more efficiently so that any person operation on that data becomes easy.

Note:-

- Every data structure is used to organize the large amount of data.
- Every data structure follows a particular principle.
- The operation of DS should not violate the basic principles of that DS.

Types of Data Structures:-

- Linear DS
- Non-linear DS

* Linear DS:- It is a structure that organizes the data in sequential order, then that data structure is called a linear data structure.

Example:- Arrays, list (linked list), stack, queue
